# Honeywell

# Oil Burner Safety Control TF 834.3 / 836.3

For 1- or 2-stage oil power burners up to 30kg/h capacity with or without oil preheater and intermittent operations.

Flame detection:

- Photoresistor MZ 770 S
- Infrared-flicker detector IRD 1010.1
- UV solid state sensor UVD 970

# **APPLICATION RANGE**

The TF 834.3 or TF 836.3 oil burner safety control boxes are suitable to control and monitor oil power burner up to 30 kg/ h capacity (approved and certified according to EN230). A special contact in the control unit short-circuits the thermo-switch of the oil preheater as soon as the burner is operating and the flame signal is present. Therefore interruption of the burner due to decreasing oil temperature (e.g. in case of high oil flow) can be prevented.

If the control box goes into lock-out mode, the oil preheater power supply is also disconnected.

# **TYPES AVAILABLE**

TF 834.2	1-stage operation post-ignition time ca. 20 sec. low voltage protection according to EN230
TF 834 E.3	1-stage operation no post-ignition
	low voltage protection according to EN230.
TF 836.3	2-stage operation post-ignition time 2-4 sec. low voltage protection according to EN230

# **CONSTRUCTIONAL FEATURES**

The control box circuitry is protected by a flame resistant, transparent plastic housing. It incorporates the thermomechanical, temperature compensated timer, flame check and reset circuits.

Manual reset from lockout is provided by a push button with an integrated lockout signal lamp. A central fixing screw locks the control box to the wiring base. The wiring base and control box have a positive plug-in arrangement, making it impossible to achieve an incorrect connection between the two parts. A variety of cable entry points provides utmost flexibility of electrical wiring.

The TF 834 and TF 834 E are fully compatible with the TF 734 and TF 734-2 respectively.

An optional extension button (item no. 70601) compensates for height differences to the TF 730 series.

# **APPLICATION NOTES**

## 1. Flame control

The following detectors can be used for flame control:

- For yellow oil flame: photoresistor MZ 770 S
- for blue or yellow flame: infrared-flicker detector type IRD

1010.1 or as alternative the UV solid state sensor UVD 970. Using the photo resistor MZ 770 S, the no flame signal is generated at light levels below 3 Lux with respect to the operating cycle of the control. According to EN 230 stray light safety level has to be established in conjunction with the accompanying burner.

Connecting the IRD 1010.1 or the UVD 970, the correct wiring has to be observed.

# 2. Burner control

# With oil preheater:

The fuel heater of the burner must have a temperature control switch. The closing contact-switch of the preheater has to be connected between terminals 4 and 6. A special contact in the control unit-connects the thermo-switch of the heater as soon as the burner is operating and a photocurrent is generated. Therefore an interruption of the burner operation due to a decrease in oil temperature is prevented (e.g. in case of high oil flow).

According to EN 230 A2.1, the short circuiting of the thermoswitch is allowed only for an oil flow of max. 10 kg/h. Burners with a higher throughput have to shut down if the oil temperature gets below the allowed minimum. In such a case the thermo-switch has to be put in the phase-circuit and terminals 4 and 6 have to be connected with a link.

# Without oil heater:

In such a case the terminals 4 and 6 have to be connected with a link.

# 3. Low-voltage protection

The start up of the burner can only take place if the mains voltage is higher than a limit which is 15% below nominal value. If the voltage drops below 160V, a start-up is prevented or – without allowing to release the fuel – the control box goes into lock out mode.

# 4. Safety

The design and control sequence of the TF 834.3, TF 834 E.3 and TF836.3 control boxes comply with the currently applicable European standards and regulations.

# 6. Mounting and electrical wiring

Wiring base:

- 3 earth terminals with additional terminal for burner earthing
- 3 neutral terminals with internal permanent connection to neutral terminal 8
- 2 independant spare terminals (S1 and S2)
- extra terminals A, B and C are standard (wiring base S98 12-pin)
- 2 slide-in plates and 2 easy knock out holes plus 2 knock out holes in the base bottom faciliate the base wiring

#### Please note

To assist trouble-free operation the main neutral connection terminal 8 in the wiring base must be fully tightened. The terminal screws are already in the undone position. To connect a wire to the terminal, the screw only needs to be fastened.

#### General:

 The control box can be mounted in any position. The protection class is IP44 (water spray tight). Neither the control box nor the flame detector should be subjected to excessive vibration.

# COMMISSIONING AND ROUTINE CHECKS

#### 1. Important notes

- The controls must be installed by qualified personnel only. The relevant national regulations have to be observed.
- On commissioning the wiring has to be carefully checked according the appropriate diagram, Incorrect wiring can damage the unit and endanger the installation.
- The fuse rating has to ensure that the limits specified in TECHNICAL DATA will not be exceed. If these precautions are not observed, the effect of a short circuit can cause severe damage to the control and installation.
- For safety reasons a minimum of one control shut-down per 24 hours has to be observed.
- Disconnect the mains before the control box is plugged in or out!
- The control box is a safety device and must not be opened!

# 2. Function control

For safety reasons the flame detection system should be tested on commissioning the installation as well as after a service or longer shut-down.

- a) Start-up with covered flame detector
  - After lock-out safety time is over the unit has to go in to lockout mode!
- b) Start-up with exposed flame detector:
  - After 20 sec. pre-purge time the unit has to go into lockout mode!
- c) Normal start-up with burner in the normal position, cover up the flame detector:
  - After start-up, and end of lock-out safety time the unit has to go into lockout mode!

# 3. Fault findings

- Burner is not working:
- thermostat circuit open
- faulty electrical wiring
- mains voltage too low

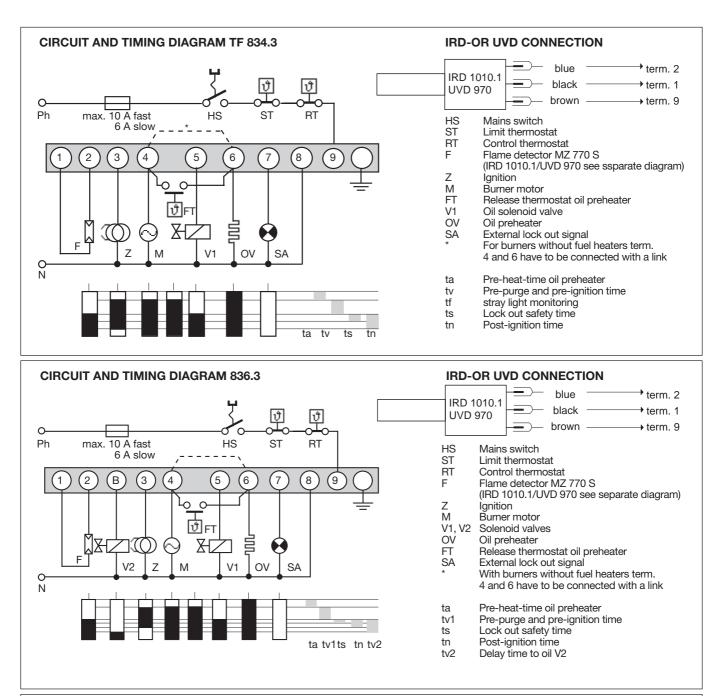

Burner starts, but the flame does not establish, a lock out occurs:

- stray light on flame detector
- no ignition or no fuel
- mains voltage more than -15% below nominal value.

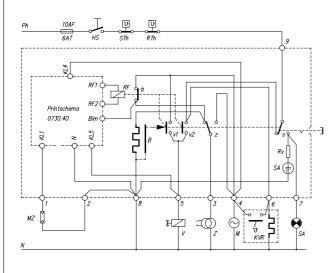

Burner starts, the flame establishes, but after the safety time, a lock out occurs:

- dirty or faulty flame detector
- insufficient light on detector
- sensitivity adjustment too low on IRD.

For a quick and safe diagnosis use the Honeywell UP 940 burner test box.
